

# FLY FASTER? FLY SHORTER!

## AZIMUTHAL EQUIDISTANT

Azimuthal equidistant is a circular chart that allows to correctly read the angle formed from any two points on the Earth to the centre of the map: the North Pole.

The adjective "equidistant" that distances from the centre of the map to any point on Earth are perfectly proportional.

The South Pole is represented as the whole outer circumference: for this reason a plane moving near the South Pole will appear extremely fast!
